

Transport Systems

Special flat top rail cars

Special flat top rail cars are required for transporting Container 7. A maximum of three filled or four empty containers can be transported on one rail car.

The container removed from the car with a crane and lifting tackle.

Alternatively the container can also be emptied directly from the car if the transfer station is suitably designed.

Platforms and ISO Flats

In order to provide safer and faster transport, particularly for containers carried by rail or sea, we have developed platforms from ISO flats.

(Up to six Container 6 can be transported on one platform or in a 20' frame.) The platforms have dimensions 20' x 8' (the frames 20' x 8' x 4'3").

Four container 6.1 or two container 8 can each be placed in one flat (see images below).

For emptying purposes the containers are removed from the transport unit. ISO flats (or frames) should then be returned with empty containers as soon as possible.
